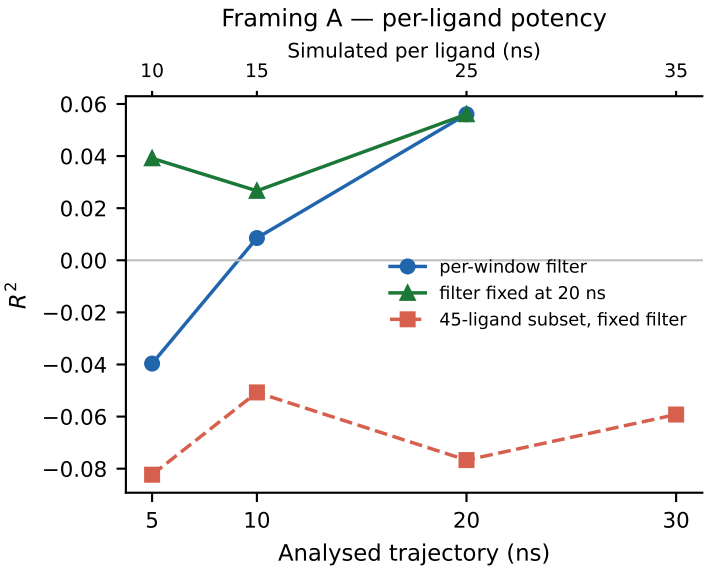
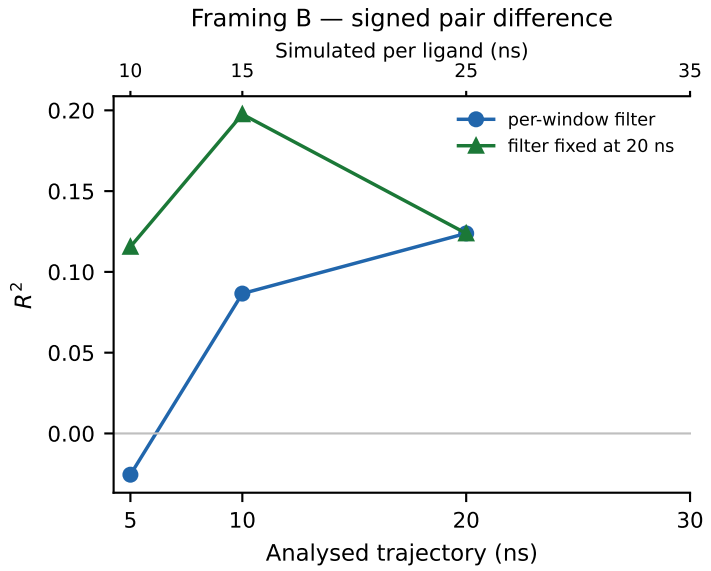
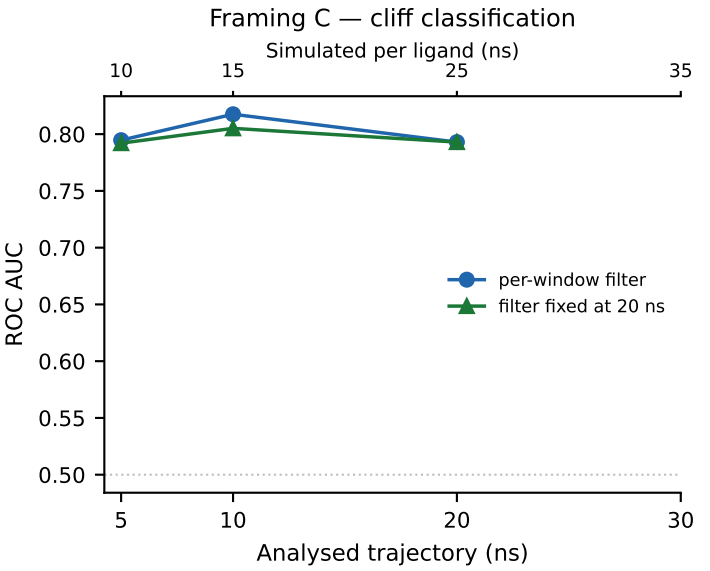
Trajectory length is not the limiting factor between 5 and 20 ns







Descriptors recomputed on the first 5/10/20/30 ns of analysed trajectory; frozen 5-fold CV, best over algorithm families. The per-window filter selects 15/14/12 descriptors, so it confounds trajectory length with descriptor choice; the fixed series holds the 20 ns selection at every window and answers length alone. Only 45 dev ligands (11 pairs) reach 30 ns, so the full-sample series stop at 20 ns.
