Production trajectory
229 runs
a frame every 10 ps
receptor, ligand, ions
and water
Periodic boundary
each molecule made whole
along its own bonds, held
in the first-frame image,
then the receptor
superposed by Kabsch
Analysis window
the first 5 ns discarded
the next 20 ns analysed
the same window for
every ligand
Per-frame series
32 descriptors, being
persistences, fluctuations
and event counts,
14 of them per residue
Reliability filter
between-ligand spread
against between-replicate
spread, over the
replicate pilot
11 pass the filter, 12 features
all 32 kept, 33 features
Two feature sets, both scored
replicates averaged to one row per ligand, 217 of them, and a signed difference per pair over 145 development pairs
the heavy-atom count carried beside either set as a size covariate, and it is the twelfth feature of the one and the thirty-third of the other
